

WEAK SOLUTIONS FOR A STRONGLY-COUPLED NONLINEAR SYSTEM

OSMUNDO A. LIMA, ALDO T. LOURÊDO, ALEXANDRO O. MARINHO

ABSTRACT. In this paper the authors study the existence of local weak solutions of the strongly nonlinear system

$$\begin{aligned}u'' + \mathcal{A}u + f(u, v)u &= h_1 \\v'' + \mathcal{A}v + g(u, v)v &= h_2\end{aligned}$$

where \mathcal{A} is the pseudo-Laplacian operator and f , g , h_1 and h_2 are given functions.

1. INTRODUCTION

Let Ω be an open and bounded subset in \mathbb{R}^n with smooth boundary Γ and let T be a positive real number. In the cylinder $Q = \Omega \times]0, T[$, with lateral boundary $\Sigma = \Gamma \times]0, T[$, we consider the nonlinear system

$$\begin{aligned}u'' + \mathcal{A}u + f(u, v)u &= h_1 \\v'' + \mathcal{A}v + g(u, v)v &= h_2 \\u(0) = u_0, \quad v(0) = v_0, \quad u'(0) = u_1, \quad v'(0) = v_1 \\u = v = 0 \quad \text{on } \Sigma = \Gamma \times]0, T[\end{aligned} \tag{1.1}$$

where

$$\mathcal{A}u = - \sum_{i=1}^n \frac{\partial}{\partial x_i} \left(\left| \frac{\partial u}{\partial x_i} \right|^{p-2} \frac{\partial u}{\partial x_i} \right), \quad p > 2,$$

is the pseudo-Laplacian operator, f is a continuous function in the first variable and Lipschitz in the second variable and g is a Lipschitz's function in the first variable and continuous in the second variable, with $f(0, 0) = g(0, 0) = 0$ and u_0, v_0, u_1, v_1, h_1 and h_2 are given functions.

When $p \geq 2$, many authors studied the system (1.1). For instance, we can mention: Segal [11], where the physical meaning of (1.1) is presented, Medeiros and Menzala [9], Medeiros and M. Miranda [10], Castro [3], Biazutti [1] and more recently, Clark and Lima [6] showed the existence, a local solution and its uniqueness for the system

$$u'' - \Delta u + f(u, v)u = h_1 \quad \text{in } Q = \Omega \times (0, T)$$

2000 *Mathematics Subject Classification.* 35L85, 35L05, 35L20, 35L70, 49A29.

Key words and phrases. Weak solutions; coupled system; monotonic operator.

$$\begin{aligned} v'' - \Delta u + g(u, v)v &= h_2 \quad \text{in } Q \\ u(0) &= u_0, \quad u'(0) = u_1 \quad \text{in } \Omega \\ v(0) &= v_0, \quad v'(0) = v_1 \quad \text{in } \Omega \\ u &= 0, \quad v = 0 \quad \text{on } \Sigma = \Gamma \times (0, T), \end{aligned}$$

where the functions f and g satisfying the same conditions of the problem (1.1). Castro [3] showed the existence of solution for the system

$$\begin{aligned} u'' + \mathcal{A}u - \Delta u' + |v|^{\rho+2}|u|^\rho u &= f_1 \quad \text{in } Q \\ v'' + \mathcal{A}v - \Delta v' + |u|^{\rho+2}|v|^\rho v &= f_2 \quad \text{in } Q \\ u(0) &= u_0, \quad u'(0) = u_1 \quad \text{in } \Omega \\ v(0) &= v_0, \quad v'(0) = v_1 \quad \text{in } \Omega \\ u &= 0, \quad v = 0 \quad \text{on } \Sigma, \end{aligned}$$

where \mathcal{A} is the pseudo-Laplacian operator. We can show that the functions $f(u, v) = |u|^{\rho+2}|v|^\rho$ and $g(u, v) = |v|^{\rho+2}|u|^\rho$, $\rho \geq -1$, satisfy the conditions of the system (1.1). Consequently the above system, without the dissipations $\Delta u'$ and $\Delta v'$, is a particular case of (*). Thus, we see that (1.1) generalizes the above mentioned problems.

To show the existence of a *local* solution for (1.1), we encounter following technical difficulties:

- (i) The choices of the functional spaces;
- (ii) In the a priori estimate for u''_m , we had that to use the projection operator, since, to derive the approximated equation we will have much technical difficulties because of the pseudo-Laplacian operator in the equation;
- (iii) In the passage to the limit, we use strongly the fact that \mathcal{A} is a monotonic and hemicontinuous operator.

We remark that these difficulties do not appear in [6].

Notation. We represent the Sobolev space of order m in Ω by

$$W^{m,p}(\Omega) = \{u \in L^p(\Omega) : D^\alpha u \in L^p(\Omega) \forall |\alpha| \leq m\},$$

with the norm

$$\|u\|_{m,p} = \left(\sum_{|\alpha| \leq m} |D^\alpha u|_{L^p(\Omega)}^p \right)^{1/p}, u \in W^{m,p}(\Omega), 1 \leq p < \infty.$$

Let $\mathcal{D}(\Omega)$ be the space of test functions in Ω and by $W_0^{m,p}(\Omega)$ we represent the closure of $\mathcal{D}(\Omega)$ in $W^{m,p}(\Omega)$. The dual space of $W_0^{m,p}(\Omega)$ is denoted by $W^{-m,p'}(\Omega)$ with p' is such that $\frac{1}{p} + \frac{1}{p'} = 1$. We use the symbols (\cdot, \cdot) and $|\cdot|$, to indicate the inner product and the norm in $L^2(\Omega)$. We use $\langle \cdot, \cdot \rangle_{W^{-1,p}(\Omega), W_0^{1,p}(\Omega)}$ to indicate the duality between $W^{-1,p'}(\Omega)$ and $W_0^{1,p}(\Omega)$ and $\|\cdot\|_0$ to indicate the norm $W_0^{1,p}(\Omega)$. The pseudo-Laplacian operator \mathcal{A} is such that

$$\begin{aligned} \mathcal{A} : W_0^{1,p}(\Omega) &\rightarrow W^{-1,p'}(\Omega) \\ u &\mapsto \mathcal{A}u \end{aligned}$$

and it satisfies the following properties:

- \mathcal{A} is monotonic, that is, $\langle \mathcal{A}u - \mathcal{A}v, u - v \rangle \geq 0, \forall u, v \in W_0^{1,p}(\Omega)$;

- \mathcal{A} is hemicontinuous, that is, for each $u, v, w \in W_0^{1,p}(\Omega)$ the function $\lambda \mapsto \langle \mathcal{A}(u + \lambda v), w \rangle$ is continuous in \mathbb{R} ;
- $\langle \mathcal{A}u(t), u(t) \rangle_{W^{-1,p'}(\Omega) \times W_0^{1,p}(\Omega)} = \|u\|_0^p$;
- $\langle \mathcal{A}u(t), u'(t) \rangle_{W^{-1,p'}(\Omega) \times W_0^{1,p}(\Omega)} = \frac{1}{p} \frac{d}{dt} \|u\|_0^p, \frac{d}{dt} = ';$
- $\|\mathcal{A}u(t)\|_{W^{-1,p'}(\Omega)} \leq C \|u\|_0^{p-1}$, where C is a constant;

We will use the same notation for the operator P and its restrictions, as well as for the operator P^* .

The next lemma plays a central role in the proof of the Existence Theorem. Its proof can be found in [6].

Lemma 1.1. *Let ϕ be a positive real function, α, β and γ , positive real constants, with $\gamma > 1$, such that*

$$\phi(t) \leq \alpha + \beta \int_0^t \{\phi(s) + \phi^\gamma(s)\} ds.$$

Then, there exists $T_0 \in \mathbb{R}$, with $0 < T_0 < T$, such that ϕ is bounded in $[0, T_0[$.

Definition. A local weak solution of the problem (1.1) is a pair of functions $u = u(x, t)$, $v = v(x, t)$ defined for all $(x, t) \in Q_{T_0} = \Omega \times (0, T_0)$, and $T_0 > 0$ fixed, satisfying

$$\begin{aligned} u, v &\in L^\infty(0, T_0; W_0^{1,p}(\Omega)); \\ u', v' &\in L^\infty(0, T_0; L^2(\Omega)); \\ \frac{d}{dt}(u', w) + \langle \mathcal{A}u, w \rangle + \langle f(u, v)u, w \rangle &= (h_1, w), \quad \forall w \in W_0^{1,p}(\Omega) \text{ in } D'(0, T_0); \\ \frac{d}{dt}(v', w) + \langle \mathcal{A}v, w \rangle + \langle g(u, v)v, w \rangle &= (h_2, w), \quad \forall w \in W_0^{1,p}(\Omega) \text{ in } D'(0, T_0); \\ u(0) = u_0, \quad u'(0) = u_1, \quad v(0) = v_0, \quad v'(0) = v_1. \end{aligned}$$

2. EXISTENCE RESULTS

Theorem 2.1. *Let f and g be functions of two variables such that f is continuous in the first variable and Lipschitz in the second variable and g is Lipschitz in the first and continuous in the second variable, with $f(0, 0) = g(0, 0) = 0$.*

$$h_1, h_2 \in L^2(0, T; L^2(\Omega)); \quad (2.1)$$

$$u_0, v_0 \in W_0^{1,p}(\Omega); \quad (2.2)$$

$$u_1, v_1 \in L^2(\Omega). \quad (2.3)$$

Then it exists $T_0 > 0$, $T_0 \in \mathbb{R}$ and functions $u : Q_{T_0} \rightarrow \mathbb{R}$ and $v : Q_{T_0} \rightarrow \mathbb{R}$ satisfying

$$u, v \in L^\infty(0, T_0; W_0^{1,p}(\Omega)); \quad (2.4)$$

$$u', v' \in L^\infty(0, T_0; L^2(\Omega)); \quad (2.5)$$

$$\frac{d}{dt}(u', w) + \langle \mathcal{A}u, w \rangle + \langle f(u, v)u, w \rangle = (h_1, w), \quad \forall w \in W_0^{1,p}(\Omega), \text{ in } D'(0, T_0); \quad (2.6)$$

$$\frac{d}{dt}(v', w) + \langle \mathcal{A}v, w \rangle + \langle g(u, v)v, w \rangle = (h_2, w), \quad \forall w \in W_0^{1,p}(\Omega), \text{ in } D'(0, T_0); \quad (2.7)$$

$$u(0) = u_0, \quad v(0) = v_0; \quad (2.8)$$

$$u'(0) = u_1, \quad v'(0) = v_1. \quad (2.9)$$

The main tools in the proof of this theorem are the Faedo-Galerkin method and compactness arguments. Let $H_0^s(\Omega)$, with $s > m = n(\frac{1}{2} - \frac{1}{p}) + 1$ a separable Hilbert space such that $H_0^s(\Omega) \hookrightarrow W_0^{1,p}(\Omega)$, is a continuous and dense immersion. In $H_0^s(\Omega)$, there exists a complete orthonormal hilbertian base $\{w_j\}_{j \in \mathbb{N}}$ in $L^2(\Omega)$. We consider $V_m = [w_1, \dots, w_m]$ the subspace of $H_0^s(\Omega)$ generated by the m first vectors of the base $\{w_j\}_{j \in \mathbb{N}}$. Also, we have the following chain of continuous and dense immersions.

$$H_0^s(\Omega) \hookrightarrow W_0^{1,p}(\Omega) \hookrightarrow L^2(\Omega) \hookrightarrow W^{-1,p'}(\Omega) \hookrightarrow H^{-s}(\Omega). \quad (2.10)$$

We will divide the proof in three steps: (i) Approximated Problem, (ii) A Priori Estimates I and (iii) A Priori Estimates II.

Approximated Problem. We want to find $u_m(t), v_m(t)$ in V_m satisfying the approximated problem.

$$(u_m''(t), w) + \langle \mathcal{A}u_m(t), w \rangle + \langle f(u_m(t), v_m(t))u_m(t), w \rangle = (h_1(t), w), \quad (2.11)$$

$$(v_m''(t), w) + \langle \mathcal{A}v_m(t), w \rangle + \langle g(u_m(t), v_m(t))v_m(t), w \rangle = (h_2(t), w), \quad (2.12)$$

for all $w \in V_m$; and

$$\begin{aligned} u_m(0) &= u_{0m}, & u_m'(0) &= u_{1m}, \\ v_m(0) &= v_{0m}, & v_m'(0) &= v_{1m}; \end{aligned} \quad (2.13)$$

So that

$$\begin{aligned} u_{0m} &\rightarrow u_0, & v_{0m} &\rightarrow v_0, & \text{in } W_0^{1,p}(\Omega); \\ u_{1m} &\rightarrow u_1, & v_{1m} &\rightarrow v_1, & \text{in } L^2(\Omega). \end{aligned}$$

It can be shown that the above system satisfies the Caracthodory's conditions; therefore there exists solutions $u_m(t), v_m(t)$ in $[0, t_m)$, $t_m < T$ satisfying (2.11)–(2.13).

A priori estimates I. Let us consider $w = 2u_m'(t)$ in (2.11). It follows that

$$\begin{aligned} &2(u_m''(t), u_m'(t)) + 2\langle \mathcal{A}u_m(t), u_m'(t) \rangle + 2\langle f(u_m(t), v_m(t))u_m(t), u_m'(t) \rangle \\ &= (h_1(t), u_m'(t)). \end{aligned}$$

Thus

$$\frac{d}{dt}|u_m'(t)|^2 + \frac{2}{p} \frac{d}{dt} \|u_m(t)\|_0^p = 2(h_1(t), u_m'(t)) - 2\langle f(u_m(t), v_m(t))u_m(t), u_m'(t) \rangle.$$

Similarly, setting $w = 2v_m'(t)$ in (2.12) it follows that

$$\frac{d}{dt}|v_m'(t)|^2 + \frac{2}{p} \frac{d}{dt} \|v_m(t)\|_0^p = 2(h_2(t), v_m'(t)) - 2\langle g(u_m(t), v_m(t))v_m(t), v_m'(t) \rangle.$$

Summing the two equalities above, then integrating from 0 to t , $t < t_m$, and using the Cauchy-Schwarz's inequality and $ab \leq \frac{a^2+b^2}{2}$, we obtain

$$\begin{aligned} &|u_m'(t)|^2 + |v_m'(t)|^2 + \frac{2}{p} \|u_m(t)\|_0^p + \frac{2}{p} \|v_m(t)\|_0^p \\ &\leq |u_m'(0)|^2 + |v_m'(0)|^2 + \frac{2}{p} \|u_m(0)\|_0^p + \frac{2}{p} \|v_m(0)\|_0^p \\ &\quad + 2 \int_0^t \int_{\Omega} |f(u_m(s), v_m(s))| |u_m(s)| |u_m'(s)| ds \end{aligned}$$

$$\begin{aligned}
& + 2 \int_0^t \int_{\Omega} |g(u_m(s), v_m(s))| |v_m(s)| |v'_m(s)| ds \\
& + \int_0^t (|u'_m(s)|^2 + |v'_m(s)|^2) ds + \int_0^T (|h_1(t)|^2 + |h_2(t)|^2) dt.
\end{aligned}$$

From (2.1), (2), and (2), it follows that

$$\begin{aligned}
& |u'_m(t)|^2 + |v'_m(t)|^2 + \frac{2}{p} \|u_m(t)\|_0^p + \frac{2}{p} \|v_m(t)\|_0^p \\
& \leq C + \int_0^t (|u'_m(s)|^2 + |v'_m(s)|^2) ds \\
& + 2 \int_0^t |f(u_m(s), v_m(s))| |u_m(s)| |u'_m(s)| ds \\
& + 2 \int_0^t |g(u_m(s), v_m(s))| |v_m(s)| |v'_m(s)| ds.
\end{aligned} \tag{2.14}$$

From the Sobolev immersions it is well known that

$$W_0^{1,p}(\Omega) \hookrightarrow L^q(\Omega), \quad \forall 1 \leq q \leq \frac{np}{n-p}.$$

Let $\alpha, \beta > 0$, such that $\frac{1}{\alpha} + \frac{1}{\beta} + \frac{1}{2} = 1$, with $1 \leq \alpha, \beta \leq \frac{np}{n-p}$.

Now, using Holder and Young inequalities, the inequality $ab \leq \frac{a^2+b^2}{2}$ and the hypothesis over f , we have

$$\begin{aligned}
& 2 \int_0^t \int_{\Omega} |f(u_m(s), v_m(s))| |u_m(s)| |u'_m(s)| ds \\
& \leq C \int_0^t \int_{\Omega} |v_m(s)| |u_m(s)| |u'_m(s)| ds \\
& \leq C \int_0^t \left(\int_{\Omega} |v_m(s)|^{\alpha} \right)^{\frac{1}{\alpha}} \left(\int_{\Omega} |u_m(s)|^{\beta} \right)^{\frac{1}{\beta}} \left(\int_{\Omega} |u'_m(s)|^2 \right)^2 \\
& = C \int_0^t |v_m(s)|_{L^{\alpha}(\Omega)} |u_m(s)|_{L^{\beta}(\Omega)} |u'_m(s)|_{L^2(\Omega)} ds \\
& \leq C \int_0^t \left\{ \frac{1}{p} |v_m(s)|_{L^{\alpha}(\Omega)}^p + \frac{p-1}{p} |u_m(s)|_{L^{\beta}(\Omega)}^{\frac{p}{p-1}} \right\} |u'_m(s)|_{L^2(\Omega)} ds \\
& \leq C \int_0^t \left\{ \frac{1}{p} |v_m(s)|_{L^{\alpha}(\Omega)}^p + \frac{1}{p} |u_m(s)|_{L^{\beta}(\Omega)}^{\frac{p}{p-1}(p-1)} + \frac{p-2}{p-1} \right\} |u'_m(s)|_{L^2(\Omega)} ds \\
& = C \int_0^t \left\{ \frac{1}{p} |v_m(s)|_{L^{\alpha}(\Omega)}^p + \frac{1}{p} |u_m(s)|_{L^{\beta}(\Omega)}^p + \frac{p-2}{p-1} \right\} |u'_m(s)|_{L^2(\Omega)} ds \\
& \leq C \int_0^t \left\{ \frac{1}{p} |v_m(s)|_{L^{\alpha}(\Omega)}^p + \frac{1}{p} |u_m(s)|_{L^{\beta}(\Omega)}^p + \frac{p-2}{p-1} \right\}^2 + |u'_m(s)|_{L^2(\Omega)}^2 ds \\
& \leq C \int_0^t \left\{ \frac{1}{p^2} |v_m(s)|_{L^{\alpha}(\Omega)}^{2p} + \frac{1}{p^2} |u_m(s)|_{L^{\beta}(\Omega)}^{2p} + \left(\frac{p-2}{p-1}\right)^2 + |u'_m(s)|_{L^2(\Omega)}^2 \right\} ds \\
& \leq C \int_0^t \left\{ \frac{1}{p^2} |v_m(s)|_{L^{\alpha}(\Omega)}^{2p} + \frac{1}{p^2} |u_m(s)|_{L^{\beta}(\Omega)}^{2p} + 1 + |u'_m(s)|_{L^2(\Omega)}^2 \right\} ds.
\end{aligned}$$

Since $W_0^{1,p}(\Omega) \hookrightarrow L^\alpha(\Omega)$ and $W_0^{1,p}(\Omega) \hookrightarrow L^\beta(\Omega)$, it follows that

$$\begin{aligned} & 2 \int_0^t \int_\Omega |f(u_m(s), v_m(s))| |u_m(s)| |u'_m(s)| ds \\ & \leq C \int_0^t \left\{ \frac{1}{p^2} \|v_m(s)\|_0^{2p} + \frac{1}{p^2} \|u_m(s)\|_0^{2p} + 1 + |u'_m(s)|_{L^2(\Omega)}^2 \right\} ds. \end{aligned} \quad (2.15)$$

Similarly, we have

$$\begin{aligned} & 2 \int_0^t \int_\Omega |g(u_m(s), v_m(s))| |v_m(s)| |v'_m(s)| ds \\ & \leq C \int_0^t \left\{ \frac{1}{p^2} \|u_m(s)\|_0^{2p} + \frac{1}{p^2} \|v_m(s)\|_0^{2p} + 1 + |v'_m(s)|_{L^2(\Omega)}^2 \right\} ds. \end{aligned} \quad (2.16)$$

Substituting, (2.15) and (2.16) in (2.14),

$$\begin{aligned} & |u'_m(t)|^2 + |v'_m(t)|^2 + \frac{2}{p} \|u_m(t)\|_0^p + \frac{2}{p} \|v_m(t)\|_0^p \\ & \leq C + C \int_0^t (|u'_m(s)|^2 + |v'_m(s)|^2) ds + C \int_0^t \{ \|u_m(s)\|_0^{2p} + \|v_m(s)\|_0^{2p} \} \\ & \quad + C \int_0^t 2 ds \\ & \leq C + C \int_0^t (|u'_m(s)|^2 + |v'_m(s)|^2) ds + C \int_0^t \{ \|u_m(s)\|_0^{2p} + \|v_m(s)\|_0^{2p} \} \\ & \quad + C \int_0^T 2 ds \\ & \leq C + C \int_0^t (|u'_m(s)|^2 + |v'_m(s)|^2) ds + C \int_0^t \{ \|u_m(s)\|_0^{2p} + \|v_m(s)\|_0^{2p} \}. \end{aligned} \quad (2.17)$$

Note that

$$\begin{aligned} & \frac{2}{p} |u'_m(t)|^2 + \frac{2}{p} |v'_m(t)|^2 + \frac{2}{p} \|u_m(t)\|_0^p + \frac{2}{p} \|v_m(t)\|_0^p \\ & \leq |u'_m(t)|^2 + |v'_m(t)|^2 + \frac{2}{p} \|u_m(t)\|_0^p + \frac{2}{p} \|v_m(t)\|_0^p, \end{aligned}$$

with $p > 2$, It follows that

$$\begin{aligned} & |u'_m(t)|^2 + |v'_m(t)|^2 + \|u_m(t)\|_0^p + \|v_m(t)\|_0^p \\ & \leq C + C \int_0^t (|u'_m(s)|^2 + |v'_m(s)|^2) ds + C \int_0^t \{ \|u_m(s)\|_0^{2p} + \|v_m(s)\|_0^{2p} \} \\ & \leq C + C \int_0^t \left\{ (|u'_m(s)|^2 + |v'_m(s)|^2)^2 + (\|u_m(s)\|_0^p + \|v_m(s)\|_0^p)^2 \right. \\ & \quad \left. + 2(|u'_m(s)|^2 + |v'_m(s)|^2) (\|u_m(s)\|_0^p + \|v_m(s)\|_0^p) \right\} ds \\ & \quad + C \int_0^t \{ |u'_m(s)|^2 + |v'_m(s)|^2 + \|u_m(s)\|_0^p + \|v_m(s)\|_0^p \} ds \\ & = C + C \int_0^t \{ |u'_m(s)|^2 + |v'_m(s)|^2 + \|u_m(s)\|_0^p + \|v_m(s)\|_0^p \}^2 ds \end{aligned}$$

$$+ C \int_0^t \{ |u'_m(s)|^2 + |v'_m(s)|^2 + \|u_m(s)\|_0^p + \|v_m(s)\|_0^p \} ds.$$

By setting

$$\phi(t) = |u'_m(t)|^2 + |v'_m(t)|^2 + \|u_m(t)\|_0^p + \|v_m(t)\|_0^p,$$

the above inequality can be rewritten as

$$\phi(t) \leq C + C \int_0^t \{ \phi(s) + \phi^2(s) \} ds. \quad (2.18)$$

Then, by Lemma 1.1, there exists $T_0 \in \mathbb{R}$, with $0 < T_0 < T$, such that ϕ is bounded in $[0, T_0)$. From this, we have

$$|u'_m(t)|^2 + |v'_m(t)|^2 + \|u_m(t)\|_0^p + \|v_m(t)\|_0^p \leq C \quad \forall t \in [0, T_0), \quad \forall m \in \mathbb{N}. \quad (2.19)$$

Therefore, by prolongation results, we can extend the solutions $u_m(t), v_m(t)$, to the interval $[0, T_0]$.

We will estimate, now, the second derivatives $u''_m(t), v''_m(t)$. Since the procedure, to estimates $u''_m(t)$ and $v''_m(t)$ are similar, we will fix our attention only on bounding $u''_m(t)$.

2.1. A priori Estimates II. Let $P_m : L^2(\Omega) \rightarrow V_m \subset L^2(\Omega)$ be

$$P_m(h) = \sum_{j=1}^m (h, w_j) w_j,$$

the projection operator on $L^2(\Omega)$. Observe that $P_m = P_m^*$ and $P_m \in \mathcal{L}(H_0^s(\Omega))$. Now, by the approximate equation (2.12),

$$(u''_m(t), w) + \langle \mathcal{A}u_m(t), w \rangle + \langle f(u_m(t), v_m(t))u_m(t), w \rangle = (h_1(t), w) \quad (2.20)$$

for all $w \in V_m$. By the chain of immersions (2.10) we have

$$\langle u''_m(t) + \mathcal{A}u_m(t) + f(u_m(t), v_m(t))u_m(t) - h_1(t), w \rangle_{H^{-s}(\Omega), H_0^s(\Omega)} = 0,$$

for all $w \in V_m$. From this equality and the fact that $P_m w = w, \forall w \in V_m$, we have

$$P_m^*(u''_m(t) + \mathcal{A}u_m(t) + f(u_m(t), v_m(t))u_m(t) - h_1(t)) = 0$$

in V_m . From this, by the linearity of P_m^* , the fact that $u''_m \in V_m$, and by the continuous and dense immersions, we have

$$u''_m(t) = -P_m^*(\mathcal{A}u_m(t)) - P_m^*(f(u_m(t), v_m(t))u_m(t)) + P_m^*(h_1(t))$$

in $H^{-s}(\Omega)$. Thus

$$\begin{aligned} \|u''_m(t)\|_{H^{-s}(\Omega)} &\leq \|P_m^*(f(u_m(t), v_m(t))u_m(t))\|_{H^{-s}(\Omega)} \\ &\quad + \|P_m^*(\mathcal{A}u_m(t))\|_{H^{-s}(\Omega)} + \|P_m^*(h_1(t))\|_{H^{-s}(\Omega)} \end{aligned}$$

With $P_m \in \mathcal{L}(H_0^s(\Omega))$ which implies $P_m^* \in \mathcal{L}(H^{-s}(\Omega))$. Since $W^{-1,p'}(\Omega) \hookrightarrow H^{-s}(\Omega)$, it follows that $P_m^* \in \mathcal{L}(W^{-1,p'}(\Omega), H^{-s}(\Omega))$, Then

$$\|P_m^*(\mathcal{A}u_m(t))\|_{H^{-s}(\Omega)} \leq C \|(\mathcal{A}u_m(t))\|_{W^{-1,p'}(\Omega)} \leq C \|u_m(t)\|_0^{p-1}. \quad (2.21)$$

Since, $L^2(\Omega) \hookrightarrow H^{-s}(\Omega)$, we have $P_m^* \in \mathcal{L}(L^2(\Omega), H^{-s}(\Omega))$. Furthermore,

$$\|P_m^*(h_1(t))\|_{H^{-s}(\Omega)} \leq C |h_1(t)|_{L^2(\Omega)}. \quad (2.22)$$

Now, to bound the term $\|P_m^*(f(u_m(t), v_m(t))u_m(t))\|_{H^{-s}(\Omega)}$, it is necessary to place $f(u_m(t), v_m(t))u_m(t)$ in some space contained in $H^{-s}(\Omega)$. Let $\gamma, \theta \in [1, \frac{np}{n-p}]$, such

that $\frac{1}{\gamma} + \frac{1}{\theta} = 1$. Since $W_0^{1,p}(\Omega) \hookrightarrow L^q(\Omega)$ for $1 \leq q \leq \frac{np}{n-p}$, we have, in particular $W_0^{1,p}(\Omega) \hookrightarrow L^\gamma(\Omega)$. Therefore,

$$(L^\gamma(\Omega))' \hookrightarrow W^{-1,p'}(\Omega).$$

From the chain of immersions (2.10), we have $W^{-1,p'}(\Omega) \hookrightarrow H^{-s}(\Omega)$, from where

$$L^\theta(\Omega) = (L^\gamma(\Omega))' \hookrightarrow H^{-s}(\Omega) \quad (2.23)$$

Now, it is sufficient to show that $f(u_m(t), v_m(t))u_m(t) \in L^\theta(\Omega)$. From the Hölder inequality and the hypothesis on f we have

$$\begin{aligned} \int_{\Omega} |f(u_m(s), v_m(s))u_m(s)|^\theta dx &= \int_{\Omega} |f(u_m(s), v_m(s))|^\theta |u_m(s)|^\theta dx \\ &\leq C_f^\theta \int_{\Omega} |v_m(s)|^\theta |u_m(s)|^\theta dx \\ &\leq C_f^\theta \left(\int_{\Omega} |v_m(s)|^{\alpha'\theta} \right)^{1/\alpha'} \left(\int_{\Omega} |u_m(s)|^{\beta'\theta} \right)^{1/\beta'}, \end{aligned} \quad (2.24)$$

where C_f is the Lipschitz constant, associated f and $\frac{1}{\alpha'} + \frac{1}{\beta'} = 1$.

If $\theta\alpha' \leq \frac{np}{n-p}$ and $\theta\beta' \leq \frac{np}{n-p}$, then

$$\theta \leq \frac{1}{\alpha'} \frac{np}{(n-p)}, \quad \text{and} \quad \theta \leq \frac{1}{\beta'} \frac{np}{(n-p)},$$

from which,

$$2\theta \leq \left(\frac{1}{\alpha'} + \frac{1}{\beta'} \right) \frac{np}{n-p}.$$

Then, we have

$$1 \leq \theta \leq \frac{np}{2(n-p)} < \frac{np}{n-p}.$$

Noticing that $W_0^{1,p}(\Omega) \hookrightarrow L^{\theta\alpha'}(\Omega)$ and $W_0^{1,p}(\Omega) \hookrightarrow L^{\theta\beta'}(\Omega)$, we have

$$\int_{\Omega} |f(u_m(s), v_m(s))u_m(s)|^\theta dx \leq C_f^\theta |v_m(t)|_{L^{\alpha'\theta}}^\theta |u_m(t)|_{L^{\beta'\theta}}^\theta \leq C \|u_m(t)\|_0^\theta \|v_m(t)\|_0^\theta.$$

From this estimate and (2.19), it follows

$$\int_{\Omega} |f(u_m(s), v_m(s))u_m(s)|^\theta dx < \infty; \quad (2.25)$$

that is,

$$f(u_m(t), v_m(t))u_m(t) \in L^\theta(\Omega) = (L^\gamma(\Omega))', \quad \text{for } 1 \leq \theta \leq \frac{np}{2(n-p)}, \quad (2.26)$$

and

$$\|f(u_m(t), v_m(t))u_m(t)\|_{L^\theta(\Omega)} \leq C, \quad \forall m, t \in [0, T_0] \quad (2.27)$$

Similarly, we have

$$\|g(u_m(t), v_m(t))v_m(t)\|_{L^\theta(\Omega)} \leq C, \quad \forall m, t \in [0, T_0] \quad (2.28)$$

We will also need that $f(u_m(t), v_m(t))u_m^2(t) \in L^\theta(\Omega)$. In fact, by Hölder inequality,

$$\int_{\Omega} |f(u_m(s), v_m(s))u_m^2(s)|^\theta dx$$

$$\begin{aligned}
&= \int_{\Omega} |f(u_m(s), v_m(s))|^{\theta} |u_m^2(s)|^{\theta} dx \\
&\leq C_f^{\theta} \int_{\Omega} |v_m(s)|^{\theta} |u_m(s)|^{\theta} |u_m(s)|^{\theta} dx \\
&\leq C_f^{\theta} \left(\int_{\Omega} |v_m(s)|^{\xi\theta} \right)^{\frac{1}{\xi}} \left(\int_{\Omega} |u_m(s)|^{\delta\theta} \right)^{1/\delta} \left(\int_{\Omega} |u_m(s)|^{\omega\theta} \right)^{1/\omega},
\end{aligned}$$

where C_f is the Lipschitz constant, associated to f and $\frac{1}{\delta} + \frac{1}{\omega} + \frac{1}{\xi} = 1$. If $\theta\xi \leq \frac{np}{n-p}$, $\theta\delta \leq \frac{np}{n-p}$ and $\theta\omega \leq \frac{np}{n-p}$ then

$$\theta \leq \frac{1}{\xi} \frac{np}{n-p}, \quad \theta \leq \frac{1}{\delta} \frac{np}{n-p}, \quad \theta \leq \frac{1}{\omega} \frac{np}{n-p}$$

which implies

$$3\theta \leq \left(\frac{1}{\xi} + \frac{1}{\delta} + \frac{1}{\omega} \right) \frac{np}{n-p}.$$

Then

$$1 \leq \theta \leq \frac{np}{3(n-p)} < \frac{np}{n-p}.$$

Observing that $W_0^{1,p}(\Omega) \hookrightarrow L^{\theta\xi}(\Omega)$, $W_0^{1,p}(\Omega) \hookrightarrow L^{\theta\delta}(\Omega)$ and $W_0^{1,p}(\Omega) \hookrightarrow L^{\theta\omega}(\Omega)$, it follows that

$$\begin{aligned}
\int_{\Omega} |f(u_m(s), v_m(s)) u_m^2(s)|^{\theta} dx &\leq C_f^{\theta} |v_m(t)|_{L^{\xi\theta}}^{\theta} |u_m(t)|_{L^{\omega\theta}}^{\theta} |u_m(t)|_{L^{\delta\theta}}^{\theta} \\
&\leq C \|u_m(t)\|_0^{2\theta} \|v_m(t)\|_0^{\theta}.
\end{aligned} \tag{2.29}$$

This estimate and (2.19) lead us to

$$\int_{\Omega} |f(u_m(s), v_m(s)) u_m^2(s)|^{\theta} dx < \infty;$$

that is,

$$f(u_m(t), v_m(t)) u_m^2(t) \in L^{\theta}(\Omega) = (L^{\gamma}(\Omega))', \quad \text{for } 1 \leq \theta \leq \frac{np}{3(n-p)}, \tag{2.30}$$

$$\|f(u_m(t), v_m(t)) u_m^2(t)\|_{L^{\theta}(\Omega)} \leq C, \quad \forall m, t \in [0, T_0] \tag{2.31}$$

Similarly, we have

$$\|g(u_m(t), v_m(t)) v_m^2(t)\|_{L^{\theta}(\Omega)} \leq C, \quad \forall m, t \in [0, T_0] \tag{2.32}$$

Note that if $\theta \leq \frac{np}{3(n-p)}$, we still have (2.26) and (2.30), because $\frac{np}{3(n-p)} < \frac{np}{2(n-p)}$. Thus, as $L^{\theta}(\Omega) \hookrightarrow H^{-s}(\Omega)$, we have that $P_m^* \in \mathcal{L}(L^{\theta}(\Omega), H^{-s}(\Omega))$. Therefore

$$\|P_m^*(f(u_m(t), v_m(t)) u_m(t))\|_{H^{-s}(\Omega)} \leq C \|f(u_m(t), v_m(t)) u_m(t)\|_{L^{\theta}(\Omega)}. \tag{2.33}$$

Hence, from the estimates (2.21), (2.22) and (2.33). we have

$$\|u_m''(t)\|_{H^{-s}(\Omega)} \leq C \{ \|u_m(t)\|_0^{p-1} + \|f(u_m(t), v_m(t)) u_m(t)\|_{L^{\theta}(\Omega)} + |h_1(t)| \}.$$

From this inequality, it results

$$\begin{aligned}
\int_0^{T_0} \|u_m''(t)\|_{H^{-s}(\Omega)}^2 dt &\leq C \left\{ \int_0^{T_0} \|u_m(t)\|_0^{2(p-1)} dt + \int_0^{T_0} |h_1(t)|^2 dt \right. \\
&\quad \left. + \int_0^{T_0} \|f(u_m(t), v_m(t)) u_m(t)\|_{L^{\theta}(\Omega)}^2 dt \right\}.
\end{aligned}$$

Therefore, from (2.17), (2.25) and (2.1), we conclude that

$$\|u_m''(t)\|_{L^2(0,T_0;H^{-s}(\Omega))} \leq C, \quad \forall m \in \mathbb{N}. \quad (2.34)$$

Arguing in a similar way, one can deduce that

$$\|v_m''(t)\|_{L^2(0,T_0;H^{-s}(\Omega))} \leq C, \quad \forall m \in \mathbb{N}. \quad (2.35)$$

From (2.19), we have

$$\begin{aligned} \|u_m(t)\|_0 \leq C \quad \text{and} \quad \|v_m(t)\|_0 \leq C, \quad \forall m, t \in [0, T_0]. \\ |u_m'(t)| \leq C \quad \text{and} \quad |v_m'(t)| \leq C, \quad \forall m, t \in [0, T_0]. \end{aligned}$$

From where, it follows that $\text{ess sup}_{t \in [0, T_0]} \|u_m(t)\|_0 \leq C$; that is

$$\|u_m\|_{L^\infty(0, T_0; W_0^{1,p}(\Omega))} \leq C, \quad \forall m \in \mathbb{N}. \quad (2.36)$$

Similarly, we have

$$\|v_m\|_{L^\infty(0, T_0; W_0^{1,p}(\Omega))} \leq C, \quad \forall m \in \mathbb{N}; \quad (2.37)$$

$$\|u_m'\|_{L^\infty(0, T_0; L^2(\Omega))} \leq C, \quad \forall m \in \mathbb{N}; \quad (2.38)$$

$$\|v_m'\|_{L^\infty(0, T_0; L^2(\Omega))} \leq C, \quad \forall m \in \mathbb{N}; \quad (2.39)$$

Therefore, from (2.27), (2.28), (2.31), (2.32), (2.34), (2.35), (2.36), (2.37), (2.38), (2.39), we have

$$(u_m)_m, (v_m)_m \quad \text{are bounded in } L^\infty(0, T_0; W_0^{1,p}(\Omega)); \quad (2.40)$$

$$(u_m')_m, (v_m')_m \quad \text{are bounded in } L^\infty(0, T_0; L^2(\Omega)); \quad (2.41)$$

$$(u_m'')_m, (v_m'')_m \quad \text{are bounded in } L^2(0, T_0; H^{-s}(\Omega)); \quad (2.42)$$

$$(f(u_m, v_m)u_m)_m, (g(u_m, v_m)v_m)_m \quad \text{are bounded in } L^\infty(0, T_0; L^\theta(\Omega)); \quad (2.43)$$

$$(f(u_m, v_m)u_m^2)_m, (g(u_m, v_m)v_m^2)_m \quad \text{are bounded in } L^\infty(0, T_0; L^\theta(\Omega)); \quad (2.44)$$

Furthermore, since \mathcal{A} is bounded, we have

$$(\mathcal{A}u_m)_m, (\mathcal{A}v_m)_m \quad \text{are bounded in } L^\infty(0, T_0; W^{-1,p'}(\Omega)).$$

Taking Limits. From the estimates and Banach-Alaoglu-Bouabarki theorem guarantee the existence of subsequences $(u_\nu)_\nu, (v_\nu)_\nu$ of $(u_m)_m, (v_m)_m$, respectively, such that

$$u_\nu \xrightarrow{*} u, \quad v_\nu \xrightarrow{*} v \quad \text{in } L^\infty(0, T_0; W_0^{1,p}(\Omega)). \quad (2.45)$$

$$u_\nu' \xrightarrow{*} u', \quad v_\nu' \xrightarrow{*} v' \quad \text{in } L^\infty(0, T_0; L^2(\Omega)). \quad (2.46)$$

$$u_\nu'' \xrightarrow{*} u'', \quad v_\nu'' \xrightarrow{*} v'' \quad \text{in } L^2(0, T_0; H^{-s}(\Omega)). \quad (2.47)$$

$$\mathcal{A}u_\nu \xrightarrow{*} \chi, \quad \mathcal{A}v_\nu \xrightarrow{*} \eta \quad \text{in } L^\infty(0, T_0; W^{-1,p'}(\Omega)). \quad (2.48)$$

As $L^2(0, T_0; H^{-s}(\Omega))$ is reflexive, the convergence (2.47) becomes

$$u_\nu'' \rightharpoonup u'', \quad v_\nu'' \rightharpoonup v'' \quad \text{in } L^2(0, T_0; H^{-s}(\Omega)). \quad (2.49)$$

Let us consider the approximate equation (2.11) in the form

$$(u_\nu''(t), w) + \langle \mathcal{A}u_\nu(t), w \rangle + \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w \rangle = (h_1(t), w) \quad \forall w \in V_m, \nu \geq m$$

Now, multiplying the above equality by $\varphi \in D(0, T_0)$ and integrating from 0 for T_0 we obtain

$$\begin{aligned} & \int_0^{T_0} (u_\nu''(t), w) \varphi dt + \int_0^{T_0} \langle \mathcal{A}u_\nu(t), w \rangle \varphi dt + \int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w \rangle \varphi dt \\ &= \int_0^{T_0} (h_1(t), w) \varphi dt \quad \forall w \in V_m, \nu \geq m. \end{aligned}$$

Integrating by parts, we obtain

$$\begin{aligned} & - \int_0^{T_0} (u_\nu'(t), w) \varphi' dt + \int_0^{T_0} \langle \mathcal{A}u_\nu(t), w \rangle \varphi dt + \int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w \rangle \varphi dt \\ &= \int_0^{T_0} (h_1(t), w) \varphi dt \quad \forall w \in V_m, \nu \geq m. \end{aligned} \tag{2.50}$$

With $u_\nu' \xrightarrow{*} u'$ in $L^\infty(0, T_0; L^2(\Omega)) = (L^1(0, T_0; L^2(\Omega)))'$ then

$$\langle u_\nu', \phi \rangle \rightarrow \langle u', \phi \rangle, \quad \forall \phi \in L^1(0, T_0; L^2(\Omega)). \tag{2.51}$$

Convergence (2.51) with $\langle u_\nu', \phi \rangle = \int_0^{T_0} (u_\nu'(t), \phi(t)) dt$, and assuming $\phi(x, t) = w(x)\psi(t)$ imply that

$$\int_0^{T_0} (u_\nu'(t), \phi(t)) dt = \int_0^{T_0} (u_\nu'(t), w(x)) \psi(t) dt, \quad \forall w \in L^2(\Omega), \quad \forall \psi \in L^1(0, T_0).$$

Consequently, for all $w \in L^2(\Omega)$ and all $\psi \in L^1(0, T_0)$,

$$\int_0^{T_0} (u_\nu'(t), w(x)) \psi(t) dt \rightarrow \int_0^{T_0} (u'(t), w(x)) \psi(t) dt.$$

In fact,

$$\int_0^{T_0} (u_\nu'(t), w(x)) \varphi'(t) dt \rightarrow \int_0^{T_0} (u'(t), w(x)) \varphi'(t) dt,$$

for all $w \in V_m \subset W_0^{1,p}(\Omega) \subset L^2(\Omega)$ and all $\psi = \varphi'$, $\varphi \in D(0, T_0) \subset L^1(0, T_0)$. In a similar way,

$$\int_0^{T_0} \langle \mathcal{A}u_\nu(t), w(x) \rangle \psi(t) dt \rightarrow \int_0^{T_0} \langle \chi(t), w(x) \rangle \psi(t) dt,$$

for all $w \in W_0^{1,p}(\Omega)$ and all $\psi \in L^1(0, T_0)$. In fact,

$$\int_0^{T_0} (\mathcal{A}u_\nu(t), w(x)) \varphi(t) dt \rightarrow \int_0^{T_0} (\chi(t), w(x)) \varphi(t) dt,$$

for all $w \in V_m \subset W_0^{1,p}(\Omega)$ and all $\varphi \in D(0, T_0) \subset L^1(0, T_0)$.

From (2.24), we have the existence of a subsequence $(f(u_\nu, v_\nu)u_\nu)_\nu$ such that

$$f(u_\nu, v_\nu)u_\nu \xrightarrow{*} \lambda, \quad \text{in } L^\infty(0, T_0; L^\theta(\Omega)). \tag{2.52}$$

Since $L^\infty(0, T_0; L^\theta(\Omega)) \hookrightarrow L^\theta(0, T_0; L^\theta(\Omega))$, we have from (2.29) that

$$(f(u_m(t), v_m(t))u_m(t))_m, (g(u_m(t), v_m(t))v_m(t))_m$$

are bounded in $L^\theta(0, T_0; L^\theta(\Omega))$; Thus we guarantee the existence of a subsequence, denoted as above, such that

$$f(u_\nu, v_\nu)u_\nu \rightharpoonup \lambda, \quad \text{in } L^\theta(0, T_0; L^\theta(\Omega)). \tag{2.53}$$

Since

$$(u'_m)_m, \quad \text{is bounded in } L^\infty(0, T_0; L^2(\Omega)),$$

$$(u_m)_m, \quad \text{is bounded in } L^\infty(0, T_0; W_0^{1,p}(\Omega)) \overset{c}{\hookrightarrow} L^2(\Omega),$$

we have by Aubin-Lions theorem, the existence of a subsequence $(u_\nu)_\nu$ such that

$$u_\nu \rightarrow u, \quad \text{in } L^2(0, T_0; L^2(\Omega)) \equiv L^2(Q_{T_0}) \quad (2.54)$$

$$u_\nu \rightarrow u, \quad \text{a.e. in } Q_{T_0} \quad (2.55)$$

Since, the sequences $(v_m)_m, (v'_m)_m$ satisfy the same conditions, it follows that, there exists a subsequence $(v_\nu)_\nu$ such that

$$v_\nu \rightarrow v, \quad \text{in } L^2(0, T_0; L^2(\Omega)) \equiv L^2(Q_{T_0}) \quad (2.56)$$

$$v_\nu \rightarrow v, \quad \text{a.e. in } Q_{T_0} \quad (2.57)$$

From (2.55), (2.57), and of the hypothesis on f, g , we have

$$f(u_\nu, v_\nu)u_\nu \rightarrow f(u, v)u, \quad \text{a.e. in } Q_{T_0}. \quad (2.58)$$

$$g(u_\nu, v_\nu)v_\nu \rightarrow g(u, v)v, \quad \text{a.e. in } Q_{T_0}. \quad (2.59)$$

From (2.27), we have

$$\|f(u_m, v_m)u_m\|_{L^\theta(Q_{T_0})} \leq C, \quad \forall m,$$

where $L^\theta(Q_{T_0}) \equiv L^\theta(0, T_0; L^\theta(\Omega))$. From this and (2.58), by means of Lion's Lemma, it follows that

$$f(u_\nu, v_\nu)u_\nu \rightharpoonup f(u, v)u, \quad \text{in } L^\theta(Q_{T_0}),$$

for $1 \leq \theta \leq \frac{np}{3(n-p)}$. Therefore, from (2.53), we have $\lambda = f(u, v)u$ and from (2.52). This implies

$$f(u_\nu, v_\nu)u_\nu \overset{*}{\rightharpoonup} f(u, v)u, \quad \text{in } L^\infty(0, T_0; L^\theta(\Omega)). \quad (2.60)$$

Similarly,

$$g(u_\nu, v_\nu)v_\nu \overset{*}{\rightharpoonup} g(u, v)v, \quad \text{in } L^\infty(0, T_0; L^\theta(\Omega)).$$

The convergence in (2.60) implies

$$\int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w(x) \rangle \psi(t) dt \rightarrow \int_0^{T_0} \langle f(u(t), v(t))u(t), w(x) \rangle \psi(t) dt,$$

for all $w \in W_0^{1,p}(\Omega) \subset L^\gamma(\Omega)$, for all $\psi \in L^1(0, T_0)$. In fact,

$$\int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w(x) \rangle \varphi(t) dt \rightarrow \int_0^{T_0} \langle f(u(t), v(t))u(t), w(x) \rangle \varphi(t) dt,$$

for all $w \in V_m \subset W_0^{1,p}(\Omega) \subset L^\gamma(\Omega)$, for all $\varphi \in D(0, T_0) \subset L^1(0, T_0)$. Taking the limit, as $\nu \rightarrow \infty$, in (2.50) and using the convergences obtained above, we have

$$\begin{aligned} & - \int_0^{T_0} (u'(t), w) \varphi' dt + \int_0^{T_0} \langle \chi(t), w \rangle \varphi dt + \int_0^{T_0} \langle f(u(t), v(t))u(t), w \rangle \varphi dt \\ & = \int_0^{T_0} (h_1(t), w) \varphi dt, \quad \forall w \in V_m, \varphi \in D(0, T_0). \end{aligned} \quad (2.61)$$

Note that, with a similar reasoning for the approximate equation (2.12) we obtain

$$\begin{aligned} & - \int_0^{T_0} (v'(t), w) \varphi' dt + \int_0^{T_0} \langle \eta(t), w \rangle \varphi dt + \int_0^{T_0} \langle g(u(t), v(t))v(t), w \rangle \varphi dt \\ & = \int_0^{T_0} (h_2(t), w) \varphi dt, \quad \forall w \in V_m, \varphi \in D(0, T_0). \end{aligned} \quad (2.62)$$

Now, using the basis definition and the fact that V_m is dense in $W_0^{1,p}(\Omega)$, expressions (2.61) and (2.62) take the form

$$\begin{aligned} & - \int_0^{T_0} (u'(t), w) \varphi' dt + \int_0^{T_0} \langle \chi(t), w \rangle \varphi dt + \int_0^{T_0} \langle f(u(t), v(t))u(t), w \rangle \varphi dt \\ & = \int_0^{T_0} (h_1(t), w) \varphi dt, \quad \forall w \in W_0^{1,p}(\Omega), \varphi \in D(0, T_0), \end{aligned} \quad (2.63)$$

and

$$\begin{aligned} & - \int_0^{T_0} (v'(t), w) \varphi' dt + \int_0^{T_0} \langle \eta(t), w \rangle \varphi dt + \int_0^{T_0} \langle g(u(t), v(t))v(t), w \rangle \varphi dt \\ & = \int_0^{T_0} (h_2(t), w) \varphi dt, \quad \forall w \in W_0^{1,p}(\Omega), \varphi \in D(0, T_0). \end{aligned} \quad (2.64)$$

Note that, the mappings $t \mapsto (u'(t), w)$, $t \mapsto (v'(t), w)$ being functions in $L^\infty(0, T_0)$, they define distributions on $(0, T_0)$. Therefore, the first integrals of (2.63), (2.64) are the derivative of these distributions. Thus, from (2.63) we have

$$\int_0^{T_0} \left\{ \frac{d}{dt} (u'(t), w) + \langle \chi(t), w \rangle + \langle f(u(t), v(t))u(t), w \rangle - (h_1(t), w) \right\} \varphi dt = 0$$

for all $w \in W_0^{1,p}(\Omega)$ and all $\varphi \in D(0, T_0)$. Thus,

$$\frac{d}{dt} (u'(t), w) + \langle \chi(t), w \rangle + \langle f(u(t), v(t))u(t), w \rangle = (h_1(t), w),$$

for all $w \in W_0^{1,p}(\Omega)$, in $D'(0, T_0)$. Similarly,

$$\frac{d}{dt} (v'(t), w) + \langle \eta(t), w \rangle + \langle g(u(t), v(t))v(t), w \rangle = (h_2(t), w),$$

for all $w \in W_0^{1,p}(\Omega)$, in $D'(0, T_0)$.

If one shows that $\mathcal{A}u(t) = \chi(t)$ and $\mathcal{A}v(t) = \eta(t)$, the proof of the theorem will be complete; since the verification of the initial conditions can be done in a standard way.

The monotonicity of \mathcal{A} implies that

$$\int_0^{T_0} \langle \mathcal{A}u_\nu(t) - \mathcal{A}w, u_\nu - w \rangle dt \geq 0, \quad \forall w \in W_0^{1,p}(\Omega);$$

that is,

$$0 \leq \int_0^{T_0} \langle \mathcal{A}u_\nu(t), u_\nu \rangle dt - \int_0^{T_0} \langle \mathcal{A}u_\nu(t), w \rangle dt - \int_0^{T_0} \langle \mathcal{A}w, u_\nu(t) - w \rangle dt,$$

for all $w \in W_0^{1,p}(\Omega)$.

$$0 \leq \limsup \int_0^{T_0} \langle \mathcal{A}u_\nu(t), u_\nu \rangle dt - \int_0^{T_0} \langle \chi(t), w \rangle dt - \int_0^{T_0} \langle \mathcal{A}w, u(t) - w \rangle dt,$$

for all $w \in W_0^{1,p}(\Omega)$. Considering the approximate equation (2.11) with $m = \nu$ and $w = u_\nu(t)$ we have

$$(u_\nu''(t), u_\nu(t)) + \langle \mathcal{A}u_\nu(t), u_\nu(t) \rangle + \langle f(u_\nu, v_\nu)u_\nu, u_\nu \rangle = (h_1(t), u_\nu(t)).$$

Therefore,

$$\frac{d}{dt}(u_\nu'(t), u_\nu(t)) - |u_\nu'(t)|^2 + \langle \mathcal{A}u_\nu(t), u_\nu(t) \rangle + \langle f(u_\nu, v_\nu)u_\nu, u_\nu \rangle = (h_1(t), u_\nu)$$

Integrating from 0 the T_0 we have

$$\begin{aligned} \int_0^{T_0} \langle \mathcal{A}u_\nu(t), u_\nu(t) \rangle dt &= (u_\nu'(0), u_\nu(0)) - (u_\nu'(T_0), u_\nu(T_0)) + \int_0^{T_0} |u_\nu'(t)|^2 dt \\ &\quad - \int_0^{T_0} \langle f(u_\nu, v_\nu)u_\nu, u_\nu \rangle dt + \int_0^{T_0} (h_1(t), u_\nu) dt \end{aligned} \tag{2.65}$$

Recall that $W_0^{1,p}(\Omega) \hookrightarrow L^2(\Omega)$. Since $u_\nu(0) \rightharpoonup u(0)$ in $W_0^{1,p}(\Omega)$ it implies $u_\nu(0) \rightarrow u(0)$ in $L^2(\Omega)$. Since $u_\nu'(0) \rightharpoonup u'(0)$ in $L^2(\Omega)$, it implies

$$(u_\nu'(0), u_\nu(0)) \rightarrow (u'(0), u(0)) \quad \text{in } \mathbb{R} \tag{2.66}$$

Recall that $(u_m(T_0))_m$ is bounded in $W_0^{1,p}(\Omega)$ and $(u'_m(T_0))_m$ is bounded in $L^2(\Omega)$. Thus, there exists subsequences $(u_\nu(T_0))_\nu$ and $(u'_\nu(T_0))_\nu$ such that

$$u_\nu(T_0) \rightharpoonup u(T_0) \quad \text{in } W_0^{1,p}(\Omega) \xrightarrow{c} L^2(\Omega),$$

which implies

$$\begin{aligned} u_\nu(T_0) &\rightarrow u(T_0), \text{ in } L^2(\Omega), \\ u'_\nu(T_0) &\rightharpoonup u'(T_0) \text{ in } L^2(\Omega) \end{aligned}$$

Consequently,

$$(u'_\nu(0), u_\nu(T_0)) \rightarrow (u'(T_0), u(T_0)) \quad \text{in } \mathbb{R}. \tag{2.67}$$

We have that (u'_m) bounded in $L^\infty(0, T_0; L^2(\Omega))$. Since

$$L^\infty(0, T_0; L^2(\Omega)) \hookrightarrow L^2(0, T_0; L^2(\Omega)),$$

it follows that (u'_m) is bounded in $L^2(0, T_0; L^2(\Omega))$. We also have that (u''_m) is bounded in $L^2(0, T_0; H^{-s}(\Omega))$. Therefore, by the Aubin-Lions Theorem, there exists a subsequence (u'_ν) such that

$$u'_\nu \rightarrow u' \quad \text{in } L^2(0, T_0; L^2(\Omega)) \equiv L^2(Q_{T_0}).$$

Hence

$$\int_0^{T_0} |u'_\nu(t)|^2 dt \rightarrow \int_0^{T_0} |u'(t)|^2 dt \tag{2.68}$$

Note that

$$\langle f(u_m(t), v_m(t))u_m(t), u_m(t) \rangle_{L^\theta, L^\gamma} = \langle f(u_m(t), v_m(t))u_m^2(t), 1 \rangle_{L^\theta, L^\gamma}.$$

From (2.68) we have $u_\nu^2 \rightarrow u^2$ a.e. in Q_{T_0} . Similarly

$$\int_0^{T_0} |v'_\nu(t)|^2 dt \rightarrow \int_0^{T_0} |v'(t)|^2 dt$$

hence, we have $v_\nu^2 \rightarrow v^2$ a.e. in Q_{T_0} , From (2.31), we have

$$\|f(u_\nu, v_\nu)u_\nu^2\|_{L^\theta(0, T_0; L^\theta(\Omega)) \equiv L^\theta(Q_{T_0})} \leq C, \quad \forall m. \tag{2.69}$$

From this inequality and (2.44), we guarantee the existence of a subsequence such that

$$f(u_\nu, v_\nu)u_\nu^2 \overset{*}{\rightharpoonup} \sigma \quad \text{in } L^\infty(0, T_0; L^\theta(\Omega)) \quad (2.70)$$

$$f(u_\nu, v_\nu)u_\nu^2 \rightarrow \sigma \quad \text{in } L^\theta(0, T_0; L^\theta(\Omega)) \quad (2.71)$$

Thus, from (2.55), (2.57) and the hypotheses on f, g , we have that

$$f(u_\nu, v_\nu)u_\nu^2 \rightarrow f(u, v)u^2 \quad \text{a.e. in } Q_{T_0}, \quad (2.72)$$

$$g(u_\nu, v_\nu)u_\nu^2 \rightarrow g(u, v)u^2 \quad \text{a.e. in } Q_{T_0} \quad (2.73)$$

From (2.69), (2.72) and the Lions' Lemma it follows that

$$f(u_\nu, v_\nu)u_\nu^2 \rightharpoonup f(u, v)u^2 \text{ in } L^\theta(Q_{T_0}) \equiv L^\theta(0, T_0; L^\theta(\Omega)), \quad \text{for } 1 \leq \theta \leq \frac{np}{3(n-p)}$$

From this convergence and (2.71), we have $\sigma = f(u, v)u^2$ and from (2.70),

$$f(u_\nu, v_\nu)u_\nu^2 \overset{*}{\rightharpoonup} f(u, v)u^2 \quad \text{in } L^\infty(0, T_0; L^\theta(\Omega)). \quad (2.74)$$

Similarly,

$$g(u_\nu, v_\nu)v_\nu^2 \overset{*}{\rightharpoonup} g(u, v)u^2 \text{ in } L^\infty(0, T_0; L^\theta(\Omega)).$$

The convergence (2.74) implies

$$\langle f(u_\nu, v_\nu)u_\nu^2, \psi \rangle \rightarrow \langle f(u, v)u^2, \psi \rangle, \quad \forall \psi \in L^1(0, T_0; L^\gamma(\Omega))$$

or better

$$\int_0^{T_0} \langle f(u_\nu, v_\nu)u_\nu^2, w(x) \rangle \varphi(t) dt \rightarrow \int_0^{T_0} \langle f(u, v)u^2, w(x) \rangle \varphi(t) dt,$$

for all $w \in L^\gamma(\Omega)$ and all $\varphi \in L^1(0, T_0)$. When fixing $w \equiv 1$ and $\varphi \equiv 1$, we have

$$\int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), u_\nu(t) \rangle dt = \int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu^2(t), 1 \rangle dt$$

which approaches

$$\int_0^{T_0} \langle f(u(t), v(t))u^2(t), 1 \rangle dt = \int_0^{T_0} \langle f(u(t), v(t))u(t), u(t) \rangle dt.$$

hence

$$\int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), u_\nu(t) \rangle dt \rightarrow \int_0^{T_0} \langle f(u(t), v(t))u(t), u(t) \rangle dt, \quad (2.75)$$

as $\nu \rightarrow \infty$. Therefore, taking the limit in (2.65), using the convergence (2.66), (2.67), (2.68) and (2.75), as $\nu \rightarrow +\infty$, we have

$$\begin{aligned} \limsup \int_0^{T_0} \langle Au_\nu(t), u_\nu(t) \rangle dt &= (u'(0), u(0)) - (u'(T_0), u(T_0)) + \int_0^{T_0} |u'(t)|^2 dt \\ &\quad - \int_0^{T_0} \langle f(u(t), v(t))u(t), u(t) \rangle dt + \int_0^{T_0} (h_1(t), u(t)) dt \end{aligned}$$

From this equality and (2.75), we have

$$\begin{aligned} 0 &\leq (u'(0), u(0)) - (u'(T_0), u(T_0)) + \int_0^{T_0} |u'(t)|^2 dt - \int_0^{T_0} \langle f(u, v)u, u \rangle dt \\ &\quad - \int_0^{T_0} \langle \chi(t), w \rangle dt - \int_0^{T_0} \langle Aw, u(t) - w \rangle dt + \int_0^{T_0} (h_1(t), u(t)) dt, \end{aligned} \quad (2.76)$$

for all $w \in W_0^{1,p}(\Omega)$. From the approximate equation (2.11), we have

$$(u_\nu''(t), w) + \langle Au_\nu(t), w \rangle + \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w \rangle = (h_1(t), w), \quad \forall w \in V_m, \nu \geq m.$$

Now, let $\varphi \in C^1([0, T_0])$. Then

$$\begin{aligned} & \int_0^{T_0} (u_\nu''(t), w)\varphi + \int_0^{T_0} \langle Au_\nu(t), w \rangle \varphi + \int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w \rangle \varphi \\ &= \int_0^{T_0} (h_1(t), w)\varphi, \end{aligned}$$

for all $w \in V_m$ and all $\nu \geq m$. Setting

$$\begin{aligned} & (u_\nu'(T_0), w)\varphi(T_0) - (u_\nu'(0), w)\varphi(0) - \int_0^{T_0} (u_\nu'(t), w)\varphi' dt \\ &+ \int_0^{T_0} \langle Au_\nu(t), w \rangle \varphi dt + \int_0^{T_0} \langle f(u_\nu(t), v_\nu(t))u_\nu(t), w \rangle \varphi(t) dt \\ &= \int_0^{T_0} (h_1(t), w)\varphi(t) dt, \quad \forall w \in V_m, \varphi \in C^1([0, T_0]), \nu \geq m. \end{aligned}$$

Taking into account the previous convergence statements, it follows that

$$\begin{aligned} & (u'(T_0), w)\varphi(T_0) - (u'(0), w)\varphi(0) - \int_0^{T_0} (u'(t), w)\varphi' dt \\ &+ \int_0^{T_0} \langle \chi(t), w \rangle \varphi dt + \int_0^{T_0} \langle f(u(t), v(t))u(t), w \rangle \varphi(t) dt \\ &= \int_0^{T_0} (h_1(t), w)\varphi(t) dt, \quad \forall w \in V_m, \varphi \in C^1([0, T_0]) \end{aligned}$$

Using a basis argument and the fact that V_m is dense in $W_0^{1,p}(\Omega)$, it follows that

$$\begin{aligned} & (u'(T_0), w)\varphi(T_0) - (u'(0), w)\varphi(0) - \int_0^{T_0} (u'(t), w)\varphi' dt \\ &+ \int_0^{T_0} \langle \chi(t), w \rangle \varphi dt + \int_0^{T_0} \langle f(u(t), v(t))u(t), w \rangle \varphi(t) dt \tag{2.77} \\ &= \int_0^{T_0} (h_1(t), w)\varphi(t) dt, \quad \forall w \in W_0^{1,p}(\Omega), \varphi \in C^1([0, T_0]). \end{aligned}$$

Observing that the set of the linear combinations of the type $w\varphi$, with $w \in W_0^{1,p}(\Omega)$ and $\varphi \in C^1([0, T_0])$, is dense in the space

$$V = \{v \in L^2(0, T_0; W_0^{1,p}(\Omega)), v' \in L^2(0, T_0; L^2(\Omega))\}.$$

It follows that (2.77) is true in the space V .

Using the fact that,

$$\begin{aligned} u &\in L^\infty(0, T_0; W_0^{1,p}(\Omega)) \hookrightarrow L^2(0, T_0; W_0^{1,p}(\Omega)), \\ u' &\in L^\infty(0, T_0; L^2(\Omega)) \hookrightarrow L^2(0, T_0; L^2(\Omega)), \end{aligned}$$

we obtain that $u \in V$. So (2.77) takes the form

$$\begin{aligned} & (u'(T_0), w)\varphi(T_0) - (u'(0), w)\varphi(0) \\ &- \int_0^{T_0} (u'(t), u'(t))dt + \int_0^{T_0} \langle \chi(t), u(t) \rangle dt + \int_0^{T_0} \langle f(u, v)u, u \rangle dt \end{aligned}$$

$$= \int_0^{T_0} (h_1(t), u(t)) dt$$

Substituting this expression in (2.76), it follows that

$$0 \leq \int_0^{T_0} \langle \chi(t), u(t) - w \rangle dt - \int_0^{T_0} \langle \mathcal{A}w, u(t) - w \rangle dt, \quad \forall w \in W_0^{1,p}(\Omega).$$

Let us take $w = u(t) + \lambda v(t)$, $\lambda > 0$. Thus

$$0 \leq - \int_0^{T_0} \langle \chi(t), \lambda v(t) \rangle dt + \int_0^{T_0} \langle \mathcal{A}u(t) + \lambda v(t), \lambda v(t) \rangle dt, \quad \forall w \in W_0^{1,p}(\Omega)$$

which implies

$$0 \leq - \int_0^{T_0} \langle \chi(t), \lambda v(t) \rangle dt + \int_0^{T_0} \langle \mathcal{A}(u(t) + \lambda v(t)), \lambda v(t) \rangle dt.$$

Dividing the previous inequality by λ and letting $\lambda \rightarrow 0^+$, by the hemicontinuity of \mathcal{A} , we have

$$0 \leq - \int_0^{T_0} \langle \chi(t), v(t) \rangle dt + \int_0^{T_0} \langle \mathcal{A}(u(t)), v(t) \rangle dt, \quad \forall v \in W_0^{1,p}(\Omega).$$

Hence

$$0 \leq \int_0^{T_0} \langle \mathcal{A}u(t) - \chi(t), v(t) \rangle dt, \quad \forall v \in W_0^{1,p}(\Omega).$$

Now, for $\lambda < 0$ it follows that

$$\int_0^{T_0} \langle \mathcal{A}u(t) - \chi(t), v(t) \rangle dt \leq 0, \quad \forall v \in W_0^{1,p}(\Omega).$$

Therefore,

$$0 \leq \int_0^{T_0} \langle \mathcal{A}u(t) - \chi(t), v(t) \rangle dt \leq 0, \quad \forall v \in W_0^{1,p}(\Omega).$$

Thus $\mathcal{A}u(t) = \chi(t)$. Similarly, $\mathcal{A}v(t) = \eta(t)$. This completes the proof of the theorem.
